Latin Name: *Begonia coccinea*
Common Name: Angelwing Begonia
Family: Begoniaceae
Geographic Origin: Tropics

Soil: Use a good well-draining soil or commercial potting mix. Equal parts loam, peat, sand, and compost.

Temperature: Daytime temperatures should be between 70°-75°F and no cooler than 60°F at night.

Light: This plant prefers bright light with partial shade.

Moisture: Water every two to three days, while letting soil dry between each thorough watering.

Fertilization: This plant should be fertilized every other week, alternating between fish and seaweed fertilizers.

Grooming: Repot every two to three years. This plant does better if slightly pot-bound.

Seasonal Care: Reduce watering and fertilizing during winter months. These plants can be put outside during the summer.

Propagation: Propagate from seed or stem cuttings.

Pests and Diseases: Check for mealy bugs and whitefly.
